

A Clinician's Guide to Translating Research into Clinical Practice

Keith L. Kaufman, Ph.D.

Clearly, clinical standards have shifted toward an expectation for evidence based practice (EBP). Many funding sources require EBP for continued funding and they offer the promise of increased treatment effectiveness. At the same time, clinicians are increasingly being put in the position of evaluating research on assessment and treatment for possible adoption. This “how to” oriented workshop is designed to assist clinicians in translating research into effective clinical practice.

Topics include:

- A framework for getting the most from research articles;
- Selecting high quality assessment measures;
- Using research to enhance treatment; and
- Drawing on research to make the best case for your EBP.

Handouts and examples will help clinicians apply this approach to their practice.
